

SLUDGE PRESS

dewatering

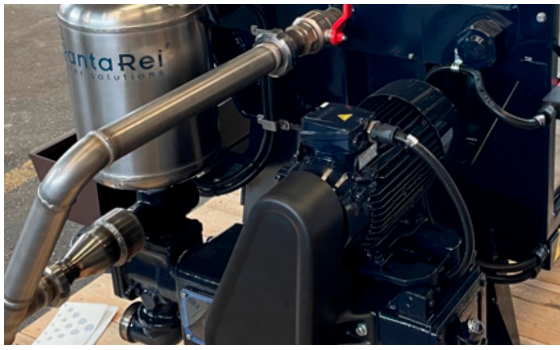

Filter Presses
for Sludge
Dewatering

The **SludgePress** by **Panta Rei** carries out the sludge dewatering by pressing the sludge between a series of porous plates. The process forces water out from the sludge by applying high pressures to the sludge layers

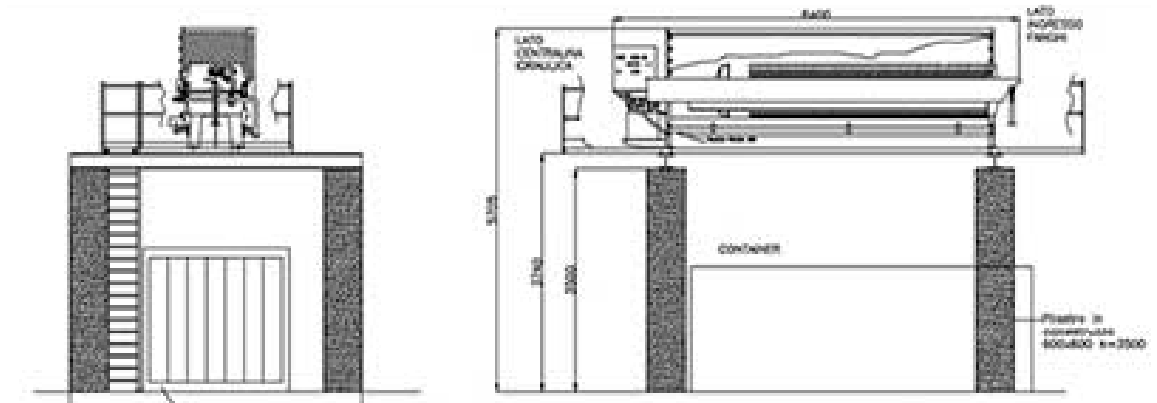

This Filter Press is the only **dewatering technology** capable of routinely achieving high concentrations of the dewatered solids cake product - between 25 and 45% DS (dry solids) depending on the feed sludge origin and the chemical conditioning applied.

This filter press is a stationary machine with **limited wear and tear** (its components remain practically unchanged over time) and **low operating and running costs**. In addition, the required installed power is very low and only occasionally needs maintenance, requiring only occasional washing and cleaning.

High efficiency technology.
